

# Hibernating Frogs

Read about frogs and then answer the questions.

Frogs are cold-blooded. This means that their body is the same temperature as the air around them. During the winter, frogs hibernate. Frogs that live on land go underground. Some also go into logs and small spaces. Sometimes the whole frog will freeze solid! When it starts to get warmer, the frog will thaw out and come back to life.

1. What do frogs do in the winter? \_\_\_\_\_

2. Where do frogs hibernate? \_\_\_\_\_

3. If a frog hibernates in a log, what can happen to it? \_\_\_\_\_

4. Draw a picture of a frog hibernating.
