

Climate Change

Read the paragraph below. Then, you are going to find the three facts that you read about.

The climate of the entire planet of Earth is changing. It is getting warmer much faster than it ever has before. Climate is the overall conditions in one area. Some different climates are dry, arctic, and rainforest. The fact that the climate of Earth is changing is a problem because as Earth gets hotter, weather in all areas of Earth will change. In some places, there will be more rain, sea levels will rise and seasons could even change.

There are several things that cause climate change. Burning fossil fuels like coal and gas and farming cause gases to go into the atmosphere. This traps heat from the sun and warms up Earth. Cutting down forests also causes climate change. This is because trees absorb carbon dioxide and without them, it stays in the air and can trap heat. People can do things to slow down climate change. Some of those things are to walk instead of driving when you can, turn off electronics when you are not using them and recycle and reduce your waste.

1. Fact 1: _____

2. Fact 2: _____

3. Fact 3: _____

4. What is the most important thing you learned about climate change? _____
